Statistics: Mean 8.102: Variance 4.826; scale 1.579

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

```
DNA fragment comprising human immunoglobulin Wh genes for the production of human immunoglobulin in mammalian hosts production of human immunoglobulin in mammalian hosts of Jair 41 Page 72-731 137pp. Japanese.

A series of genes (1299.7972) encoding human immunoglobulin variable heavy chains. The genes were selected and closed from a series of osmid constructs: V202, V203, V21, V6, V24, 3-37, M84, M18 and M131, by HCH amplification using primers QP8917-38. The genes are subdivided into 5 families of VM genes. The fragments cover a region of 800 kb. The Invalidation cutyme. The Invalidation high molecular weight PNA from human prime families of VM was partially disested with Tagl restriction cutyme. The fragments were separated by quelelectrophoresis and 35-45 kb fractions were collected. The fragments were ligated with 1301-131setcd cosmid vector P'841. The ligation profices were in citro pived and interted
                                                                     03-AUG-1995 (first entry)

Human immunoglobulin Vh gene #33.

Human immunoglobulin Vh gene #33.

Example 1: Fig 2a(1): 184pp; English.
This DNA sequence comprises the gene encoding the VH domain
This DNA sequence comprises the gene encoding the VH domain
(W1552) of human servantibody. Av.H1 (also know; as 6H1), which
is specific for transforming growth factor (TGP) beta-2. It was
isolated by panning a phage antibody library produced from cloned
quemine V genes and synthetic CDPs. The antigen-binding domains
of human antibodies (see W15522-40) to TGF beta-1 and/or beta-2 can
be used to counter the adverse effects of TGF beta-1 and/or beta-2 can
promotion of fibrosis (in dermal, ocular or keloid scarring, lung
fibrosis, arterial injury, proliferative retinopathy, retinal
detachment, adult respiratory distress syndrome, liver cirrhosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Agent contg. antigen-binding domain of human antibody to transforming growth factor beta 1 or 2 - and nucleic acid encoding it, used to neutralise effects of TGF, e.g. for control of fibrosis,

DNA fragment comprising human immunoglobulin Vh genes - for the production of human immunoglobulin in mammalian hosts

Droduction of human immunoglobulin in mammalian hosts

A scries of genes (979, 1399, 2490)

A scries of genes (979, 120, 120, 120)

A scries of genes were isolated and cloned from a series of cosmid constructs; Y20; Y103, Y21; Y5;Y44; 3.31; M84; M18 and M131, by DCR amplification using primers (78917.38. The genes are subdivided into 5 families of Vh genes. The fragments gover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with Taql restriction enzyment. The fragments were separated by gel electophoresis and 35-45 kb fractions were collected. The fragments were ligated with Clai-digested cosmid
                                                                                                                                                                                                                                                               Ö

This DNA sequence comprises the gene conding the VH domain this DNA sequence comprises the gene conding the VH domain this DNA sequence comprises the gene conding the VH domain sequence comprises the gene conding the VH down as 7A3), which is specific for transforming growth factor (TGF) beta-1. It was solicited for transforming growth factor (TGF) beta-1. It was solicited by panning a phase autibroly library produced from a peripheral blood lymphocyte library. The antigen-binding domains of human antibodies (see W15522-40) to TGF beta-1 and/or beta-2 can be used to counter the adverse effects of TGF beta, such as (i) promotion of fibrosis (in dermal, occurring, lung librosis, arterial injury, proliferative retinopathy, retinal detachment, adult respiratory distress syndrome, liver cirrhosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Agent confq. antiqen-binding domain of human antibody to

                 detachment, adult respiratory distress syndrome, liver cirrhosis, post myocardial infarction, post-angioplasty restencesis, scleroderma, vascular disorders, cataract, glaucoma, or esp. neural scarring and glomerulonephritis, also (not claimed) osteoporosis), or (ii) immune and inflammatory diseases (e.g. rheumatoid
                                                                                                             arthritis, macrophage deficiency diseases or macrophage pathogen infection). Nucleic acids encoding human antibody VH and VL can be used for prodn. Of recombinant antigen-binding domains. These are highly specific, have low dissociation constants (pref. less than 5 nM) and low 1050s for neutralisation. Sequence 369 RP. 83 A. 117 G. 81 T.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 44: Fig 18: 104pp; English.

The leader peptide and the L'V region are encoded in different reading frames. The L'V region corresponds to the last three amino edids of the leader peptide and the variable region gene.

08-DEC-1997 (first entry)
Monoclonal antibody PE1-1 Vh region coding sequence.
Heavy chain, light chain: variable region; human monoclonal antibody;
immunisation; hepatitis b virus; HBV; vaccine; mouse; fusion; xenogeneic;
peripheral blood lymphocyte; surface antipen; cell culture; ion exchange;
chromatography; size separation; primer: PCR: polymerase chain reaction;
amplification, hybridoma, infection, immunosuppression, hepatitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the nucleotide sequence encoding the heavy chain variable (Vh) region from the human monoclonal antibody (MAD) PET-1. The MAD was generated by immunishing humans with a hepatitis B virus (HBV) vaccine, isolating peripheral blood lymphocytes (PEL) and fusing them with a mouse/human xenogeneis cell line SPAR-4.
                                                                                                                                                                                                                                                                                                                      1042 gtagtgg-igg--ta-gitgc--iactoctitgactaciggggocagggaacontggina 1095

exchange throman graphy on Eastward. The heavy and light chains of the MAbs were isolated and their amino acid sequences determined. Primers were encrated and used to amplify cDNA synthesised from RNA purified from each bybridona cell line. The sequences of the heavy and light chains (nucleic acid and amino acid) from MAbs PEI-1, ZMI-1, ZMI-2 and MDN-4 are shown in TPSR38-45 and W2494-4! The Mabs can be used to treat HBV infections in immunosuppressed patients or patients with chronic active hepatitis, especially liver transplant patients.

diseases caused by infection with hepatitis's have been prefared from cell line obtained by fusing a xenogeneic hybridoma designated SPAN 4 with blood cells of a patient immunised with hepatitis B varcine. Specific antibudies are PEI-1, ZMI-1, ZMI-2, MDA-4 and 103-4, each of these being of the 1961 class. The present sequence encodes the heavy sequence (423 BP).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Luman volutheers were liminised with hepatitis B vaccine. MD3-4, ZM1-1 and PE1-1 hybridoma cell lines were derived from lymphocytes of individuals immunised with Heptavax (Morre & CO). Antibodies PE1-1, ZM1-1, MZ1-2 and XM3-4 belong to the 1751 clas. The cell lines producing PE1-1, ZM1-1 and ZM1-2 were deposited as ATCF HR923, 9191 and 9192 respectively. The cell lines all behave as typical (mouse x human) x human hybridomas and produce their respective Abs in concs. ranging up to 25 mg/l in standard suspension culture. The heavy variable (VH) and light variable (LH) chains of Abs FE1-1, ZM1-2 and MD3-4 were isolated and shapened 104a1 PNA was axiral ted film (MC) hybridoma cells of each cell line, ss DNA was synthesised using AMV-reverse

antibodies and for passive immunisation
Disclosure. Fig 14, 32pp. English.
The DNA sequence of elever more lends antibodies are
the presented in ULINAS S. Synthetic genes, for both heavy and
lith chains may be created by combining selected CDR 1, 2, and 3
regions, which may be selected from different antibody mods having
varied binding specificity. The chimaeric anti-hic antibodies can be
vised for diagnosts and therapy, and are capable of providing blood-
typing reagents of high specificity and reliability. They can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The DNA sequence of eleven monoclonal antibodies are represented to 01945 T Synthatic genes. for both heavy and light chains may be created by complining selected DNB 1. 2 and 3 regions, which may be selected from different antibody mois having varied binding specificity. The chimaeric anti-Khb antibodyses can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    144 GCCAGSTATAIGSTIIGAIGSAASIAATGAATACTAIICASACIGGTGAAGGGCGGAIT 203

immune and inflammatory disease

Example 1: Fig 1c(i): 184pp: English.

This DAN sequence comprises the gone encoding the VH domain

(M15536) of human scfv antibody 3169, which is specific for

transforming growth factor (TGF) beta-1. It was isolated from

a CPR3 spiking experiment. The autique tinding downers of

chuman antibodies (see W1552-40) to TGF beta-1 and/or beta-2 can

be used to counter the adverse effects of TGF beta-3 such as (i)

promotion of fibrosis (in dermal, ocular or keloid scarring, lung

fibrosis, arterial injury proliferation retinged

detachment, adult respiratory distress syndrome, liver cirrhosis,

post mycorardial infarction, post angioplasty restences;

scieroderma, vascular discrebers, catalact, giaucoma, or esp. genral.

of the invention preferably contains the sequence represented by Wi3912 in the complementarity determining region-1 (CDR-1) of the heavy chain variable region. The antibody of the invention also contains the sequence represented by Wi3913 in the CDR-3 of the light chain variable region. The antibody is capable of binding to adr type hepatitis B (HB) virus antigen. A human anti-HB virus monoclonal antibody preparation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antibody; heavy chain; light chain; variable region; human; monoclonal; complementarity determining region; human; adr type hepatitis B virus; HB virus; CDR: virus antigen; anti-HB antibody; vaccine; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             T60116-T60123 represent the coding sequences for the heavy and light chains of the human monoclonal antibody of the invention. scarring and glomerulonephritis, also (not claimed) osteoporosis), or (1i) immune and inflammatory diseases (e.g. rheumicin arthritis, macrophage defliciency diseases or macrophage pathogen infection) Nucleic acids encoding human antithody VH and VL can be used for prodn. of recombinant antiqen-binding domains. These are highly specific, have low dissociation constants (pref. less than 5 nM) and low 1650s for neutralisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          122 CASGCAAGGSGCTGGACTGGGTGGCAAGATATATATGTTTGATGGAAGTAATGAATAATT

Example 1: Fig 2a(ii); 184pp; English.

This DNA sequence comprises the gene encoding the VH domain

This DNA sequence comprises the gene encoding the VH domain

(W1552) of human scftv antibody 2A-96 (also known as 11E6), which

is specific for transforming growth factor (TGF) beta-2. It was

solated by panning a phage antibody library produced from cloued

germine V genes and synthetic CDPs. The antigen-binding domains

of human antibodies (see W1552.40) to TGF beta 1 and/or beta-2 can

be used to counter the adverse effects of TGF beta, such as (i)

be used to counter the adverse effects of TGF beta 2 and 3 (i)

c promotion of fibrosis (in dermal, ocular or keloid scarring, lung

fibrosis, arterial injury, proliferative retinopathy, retinal

detachment, adult respiratory distress syndrome, liver cirrhosis,

post myocardial infarction, post angioplasty restenosis.
